KEY TIME-OF-USE SUPPLEMENT: FEEDLOT

STRESSGUARD: LAMB & SHEEP FEEDLOT PROTOCOL

For calming livestock naturally. The product long-time customers know as **Green Cap** - same trusted formulation, new name.

NIL WITHHOLDING | EVERY BATCH NATA TESTED | 3-YEAR SHELF LIFE | FEEDSAFE ACCREDITED

Feedlotting puts lambs through two big stress points. StressGuard helps both. It helps calm lambs through induction and the switch from pasture to grain, supports immune function when stress knocks it down, and its **elevated natural electrolytes** assist hydration so lambs get back onto feed and water sooner.

THE PROTOCOL

STAGE 1 ARRIVAL & INDUCTION

Dose the water on arrival

- Give clean water straight away. If lambs are badly dehydrated, let them drink before dosing the trough.
- Helps lambs settle in, adjust to the new ration and go back onto feed and water sooner.

EXAMPLE: 800 lambs at 35kg x 5ml = 4L
A 5 L Dosing Drum suits this pen.

IMPORTANT NOTE: If lambs were dosed with StressGuard before trucking do not dose again on arrival.

STAGE 2 EXIT FROM FEEDLOT

Dose 3-7 days before trucking

7	6	5	4	3	2	1	LOAD
DAYS OUT: DOSE WINDOW						TOO LATE	

- Start as soon as exit lambs are drafted off. Never within 24 hours of loading, so the dose window finishes before curfew.
- Supports calmer travel, helps reduce weight shrinkage and assists hydration in transit. Every kilo lost on the truck is a kilo you've already paid to put on.

HOW TO DOSE: WITH THE PRODISPENSER

Same steps at both stages

1 MEASURE
Head x dose rate = the pen's total dose. Rates are in the dose rates table. →

2 FILL & CONNECT
Pour into a clean DosingDrum, leave approx. 20% air space and attach the ProDispenser. Small dose? Top up with water so it floats low.

3 DOSE
Sit it upside down in the trough. It releases over 3 days as water replaces it.

4 AFTER 3 DAYS
Empty what's left into the trough, rinse the drum and ProDispenser in it, and it's ready for the next pen.

PEN TIPS

- **Clean, fresh water:** sheep are fussier drinkers than cattle and will drink less from a dirty or warm trough. Keep troughs clean and topped up, and make sure the drum doesn't block access in smaller troughs.
- **Home-bred lambs:** if weaning and feedlot entry happen together, dose ewes and lambs a week before weaning. That dose covers the move into the pen.
- **Watch for shy feeders:** draft off lambs that aren't on feed after the first week or so and give them extra attention.
- **Feedlot basics still apply:** vaccinate before entry and step lambs onto grain gradually. StressGuard helps lambs through the transition. It doesn't replace either of these.
- **Even dosing:** always dispense over 3 days. Never tip the full dose straight in, as strong water can put stock off drinking.
- **Never** attach the ProDispenser to a full drum of StressGuard, and don't mix with urea or other water additives.

DOSE RATES

per head, RRP ex GST

SHEEP	DOSE	COST / DOSE
Lambs under 30 kg	2.5 mL	$0.07
Lambs over 30 kg	5 mL	$0.14
Adult sheep	10 mL	$0.29

Based on 20 L drum pricing. One dose per stress event, lasting up to 6 weeks.

Please note: StressGuard contains copper (1,500 mg/L) and selenium (1,500 mg/L). Sheep are more sensitive to copper than cattle, particularly on grain or pellet rations. Factor both into your ration's total and check with your nutritionist.

ACTIVE INGREDIENTS

16 AMINO ACIDS
SEAGRASS / KELP
The building blocks behind immune activity, gut integrity & tissue repair, helping animals rebuild condition once the event passes.

10 TRACE MINERALS
CHELATED
Boron, cobalt, copper, magnesium, manganese, potassium, selenium, sodium, sulphur & zinc.

NATURAL ELECTROLYTES
VIA FULVIC ACID
An elevated load that supports hydration, nerve & muscle function & metabolic stability when intake drops.
